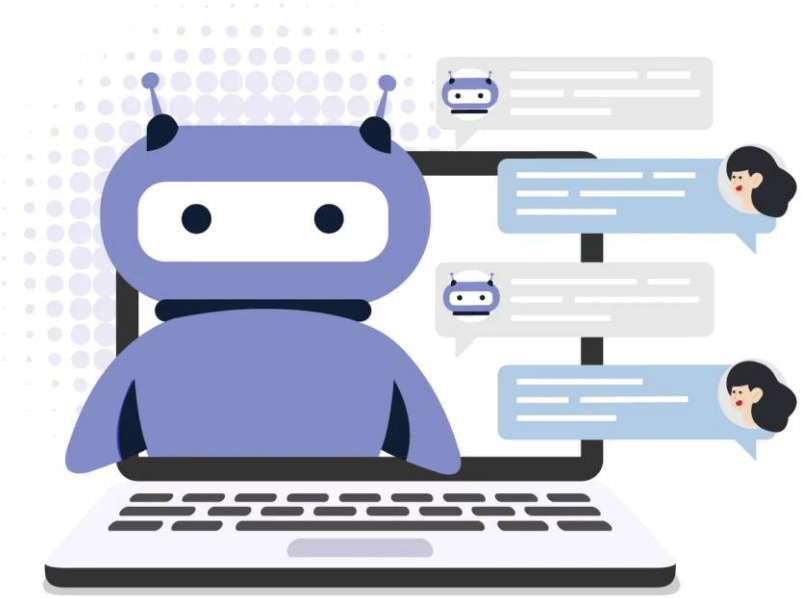
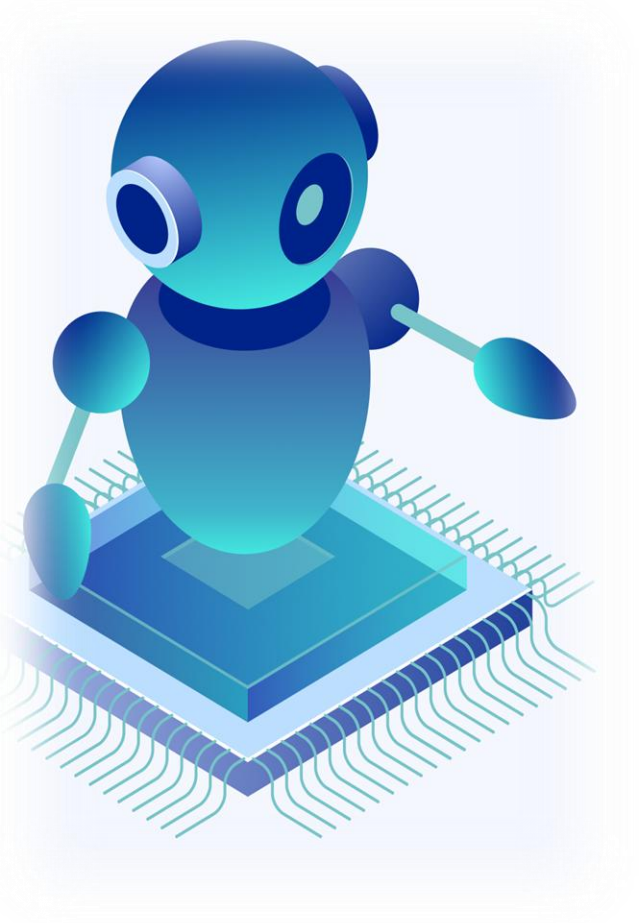
Introduction to AediaX Edge Solution



Introduction to AediaX Edge Solution



AediaX Edge Solution is an advanced AI-powered platform developed under **AediaX Tech Private Limited**, designed to act as a **virtual manager for software systems.**

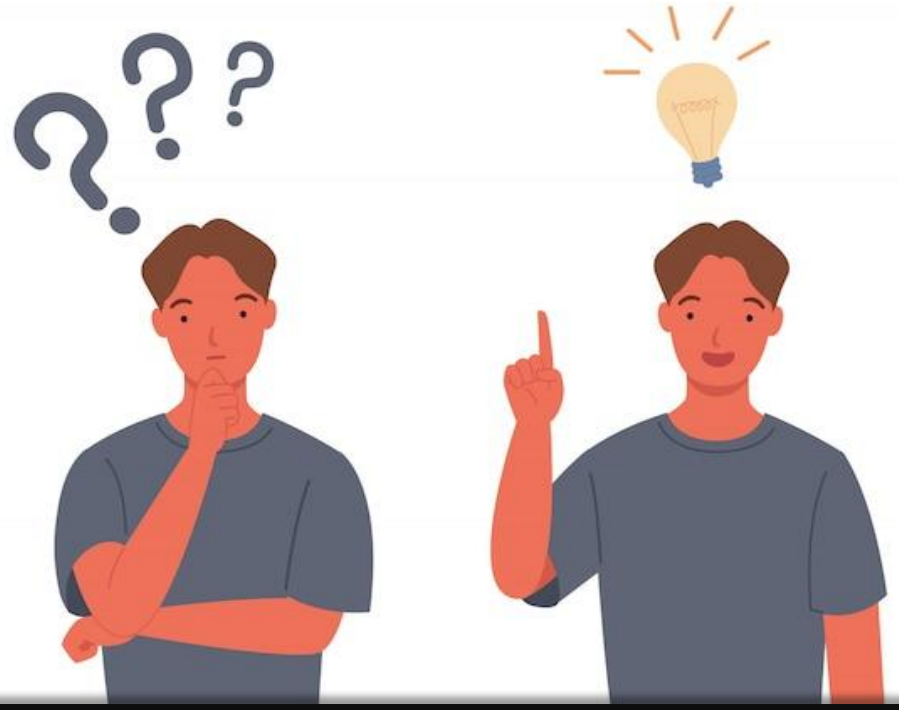
It integrates Artificial Intelligence into existing systems to automate decision-making, reporting, monitoring, and management tasks traditionally handled by human managers.

Literature Review Summary Table

Author(s) & Year	Title / Source	Method / Approach	Key Findings / Contribution	Relevance to AediaX Edge Solution
Jørgensen & Shepperd (2007)	A Systematic Review of Software Development Cost Estimation Studies	Review of estimation models (COCOMO, regression, expert judgment)	Hybrid models provide better estimation accuracy	Helps design AI-based estimation + decision system
Boehm (1981)	Software Engineering Economics (COCOMO)	Algorithmic cost estimation using project parameters	Established standard for effort & cost prediction	Acts as baseline for AI-driven automation
Li et al. (2022)	AI-Driven Project Management	Machine learning models (Random Forest, Neural Networks)	ML improves prediction accuracy using historical data	Supports AI-based management & decision engine
Ahmad et al. (2021)	NLP for Requirements Engineering	NLP techniques (NER, parsing, classification)	Improves requirement extraction and clarity	Enables AI to understand system data & user inputs
Chen & Wang (2023)	Transformer-Based Requirement Analysis	Transformer models (BERT, GPT, T5)	Better semantic understanding and automation	Core for AI manager decision-making & automation
Google AI (2024)	Gemini Developer Documentation	LLM-based multimodal AI, reasoning, code generation	Enables scalable AI systems with structured outputs	Backbone for AI manager logic & automation
Firebase Documentation (2024)	Firestore, Auth, Cloud Functions	Cloud-based backend, real-time database, authentication	Secure, scalable, real-time system architecture	Used for system data, monitoring, and automation
Davenport & Ronanki (2018)	Artificial Intelligence for the Real World	Case studies of AI in business automation	AI improves efficiency in business processes	Supports concept of AI replacing managerial roles
Russell & Norvig (2021)	Artificial Intelligence: A Modern Approach	AI algorithms, decision-making systems	AI can simulate intelligent human behavior	Foundation for building AI manager system

Motivation and Problem Statement

Managing software systems requires continuous human effort for reporting, monitoring, and decision-making. Existing systems lack intelligence and rely heavily on manual operations, leading to inefficiency and delays.



There is a need for an AI-based solution that can automate managerial tasks, analyze data, and make intelligent decisions.

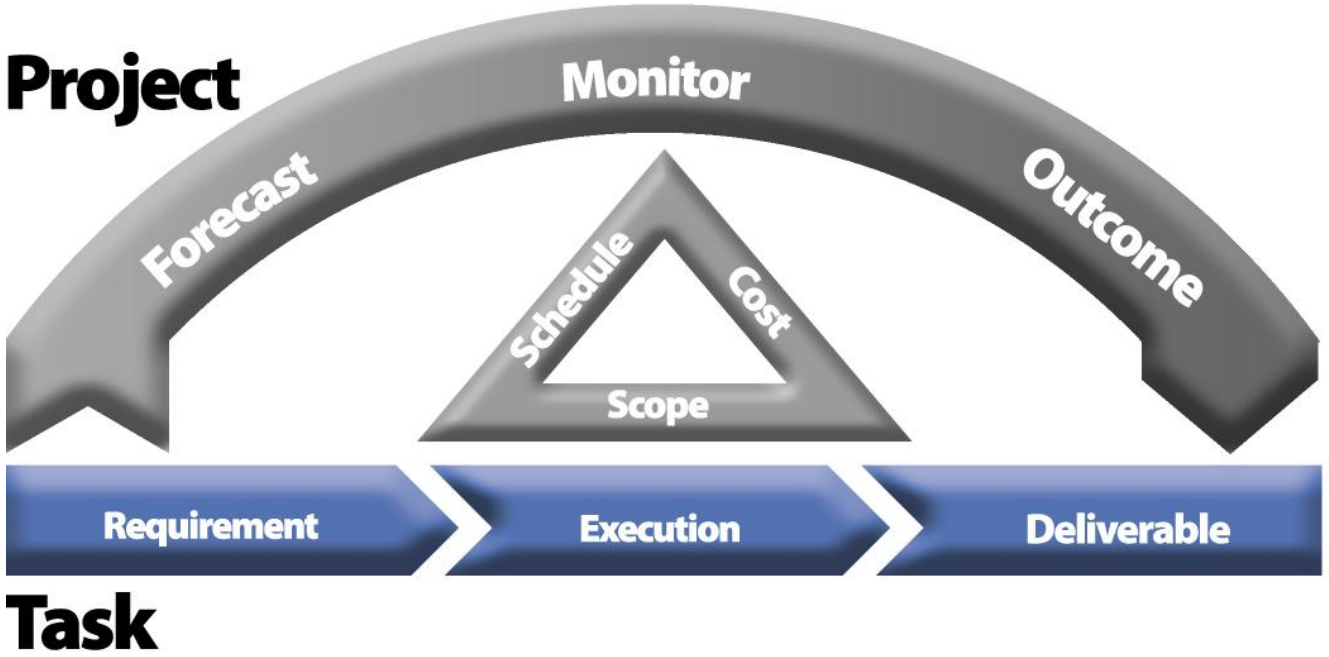
AediaX Edge Solution addresses this problem by introducing an AI-powered virtual manager capable of handling complete software management efficiently.

Objectives of the Proposed System

1. To develop an AI-based system that can act as a **virtual manager** for software applications by automating management tasks.
2. To design an intelligent module capable of **analyzing system data and user inputs** using Natural Language Processing and machine learning techniques.
3. To automatically generate **reports (PDF/Excel), insights, and summaries** from the system database without manual intervention.
4. To implement an AI-driven **decision-making engine** that can provide suggestions, predictions, and optimized actions based on available data.
5. To reduce dependency on human managers by **automating repetitive tasks** such as monitoring, reporting, and workflow management.
6. To provide **real-time system monitoring and analytics** for improved performance and faster response.
7. To ensure **secure data handling, authentication, and scalability** using modern cloud technologies.
8. To create a **multi-platform solution** (Web, Mobile, Desktop) that can be integrated into any existing software system.
9. To improve overall **efficiency, productivity, and accuracy** in software management processes.
10. To build a scalable foundation for future **AI-driven autonomous systems and smart enterprises**.

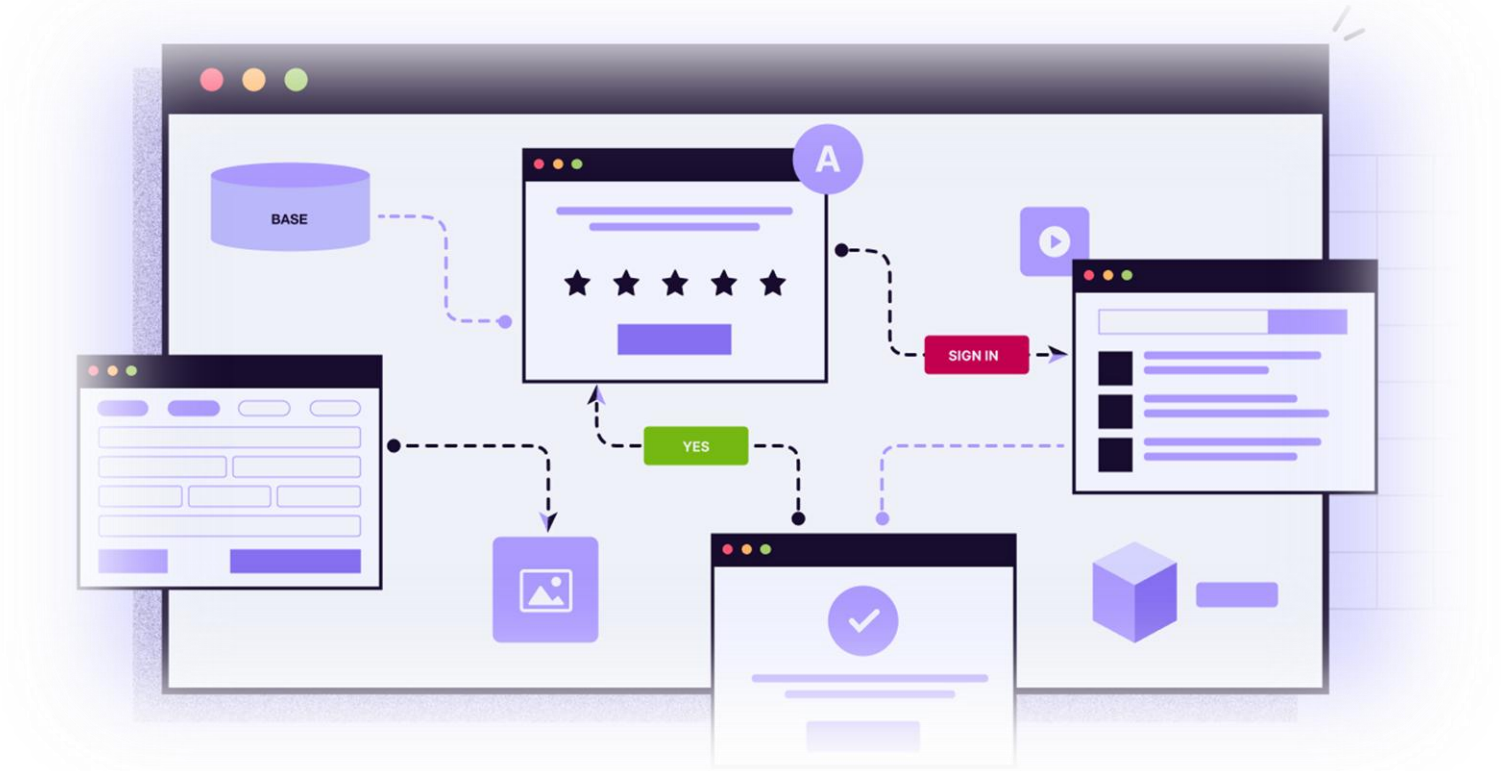
Scope of the Minor Project

1. Development of an **AI-based requirement analysis module** to interpret user ideas written in natural language.
2. Implementation of an **automated estimation engine** to generate project cost and development timelines.
3. Creation of **basic UI mock screens** automatically from extracted requirements.
4. Design of a **simple user interface** for input submission and result visualization.



5. Integration of **Natural Language Processing (NLP)** for understanding user input.
6. Implementation of **secure authentication and cloud database storage** for managing user data.
7. Development of a **functional prototype** demonstrating idea-to-requirement conversion, serving as a foundation for the major project.

Technologies Used & Work Flow



Technologies Used

The system is built using a multi-platform technology stack that supports web, Android, iOS, and desktop deployment. It integrates AI services, secure authentication, cloud databases, and multiple APIs to ensure efficient requirement analysis, smooth user interaction, and scalable performance across all devices.

Technologies Used

1. Core Technology Stack

Category	Technologies / Tools
Frontend	React, Expo, React Native (Web, Android, iOS, PC/Desktop)
Backend	Node.js, Firebase Functions
AI Layer	Gemini AI Pro API (initial stage), AediaX custom dataset
APIs Used	Google APIs, GitHub Developer API (profile image storage), Firebase API
Primary Database	Firestore (NoSQL Cloud Database)
Realtime Features	Firebase Realtime Database (sync, background updates)
Authentication	Firebase Authentication (Email, OTP, Providers)
Storage	GitHub API, Firebase Storage
Version Control	Git, GitHub
Deployment	Firebase Hosting — https://edge.aediax.com

Technologies Used

2. Additional Services

Purpose	Service / API
Push Notifications	Firebase Cloud Messaging (FCM)
Analytics & Monitoring	Google Analytics / Firebase Analytics
Testing Environment	Expo Go, Browser Preview, Android Emulator, iOS Simulator
Security Layer	Firebase Security Rules (DB + Authentication)
Deployment Workflow	GitHub Actions

Technologies Used

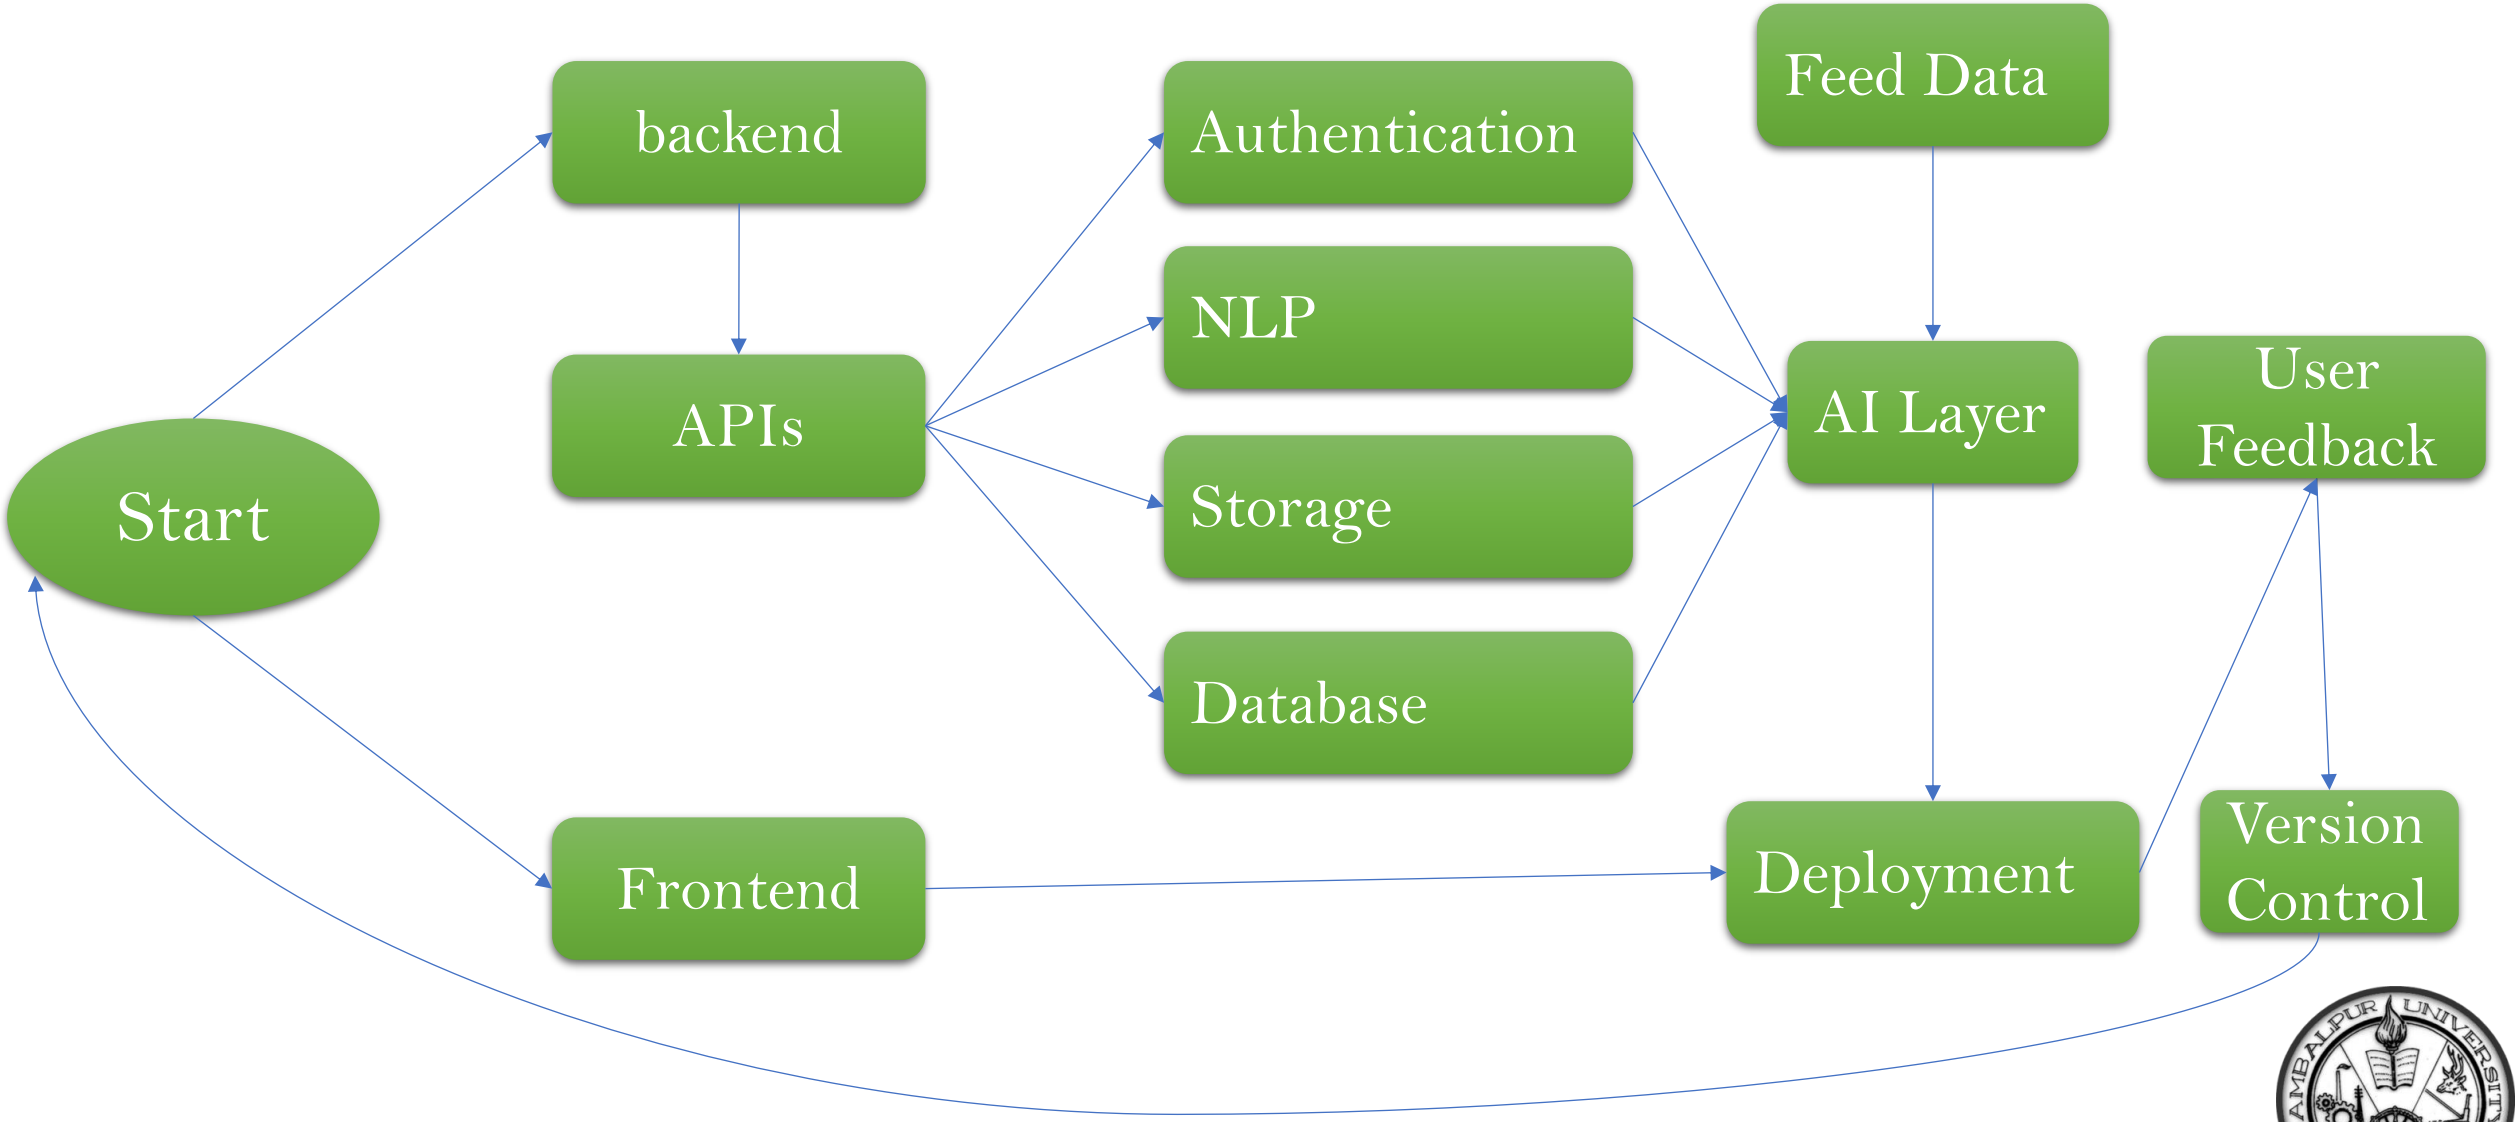
3. AI & Data Processing Layer

Component	Description
NLP Understanding	Gemini AI Pro for idea interpretation
Custom Dataset	AediaX-owned dataset for modules, patterns, cost mapping
Output Generator	Requirement extraction, estimation, basic UI mock generation

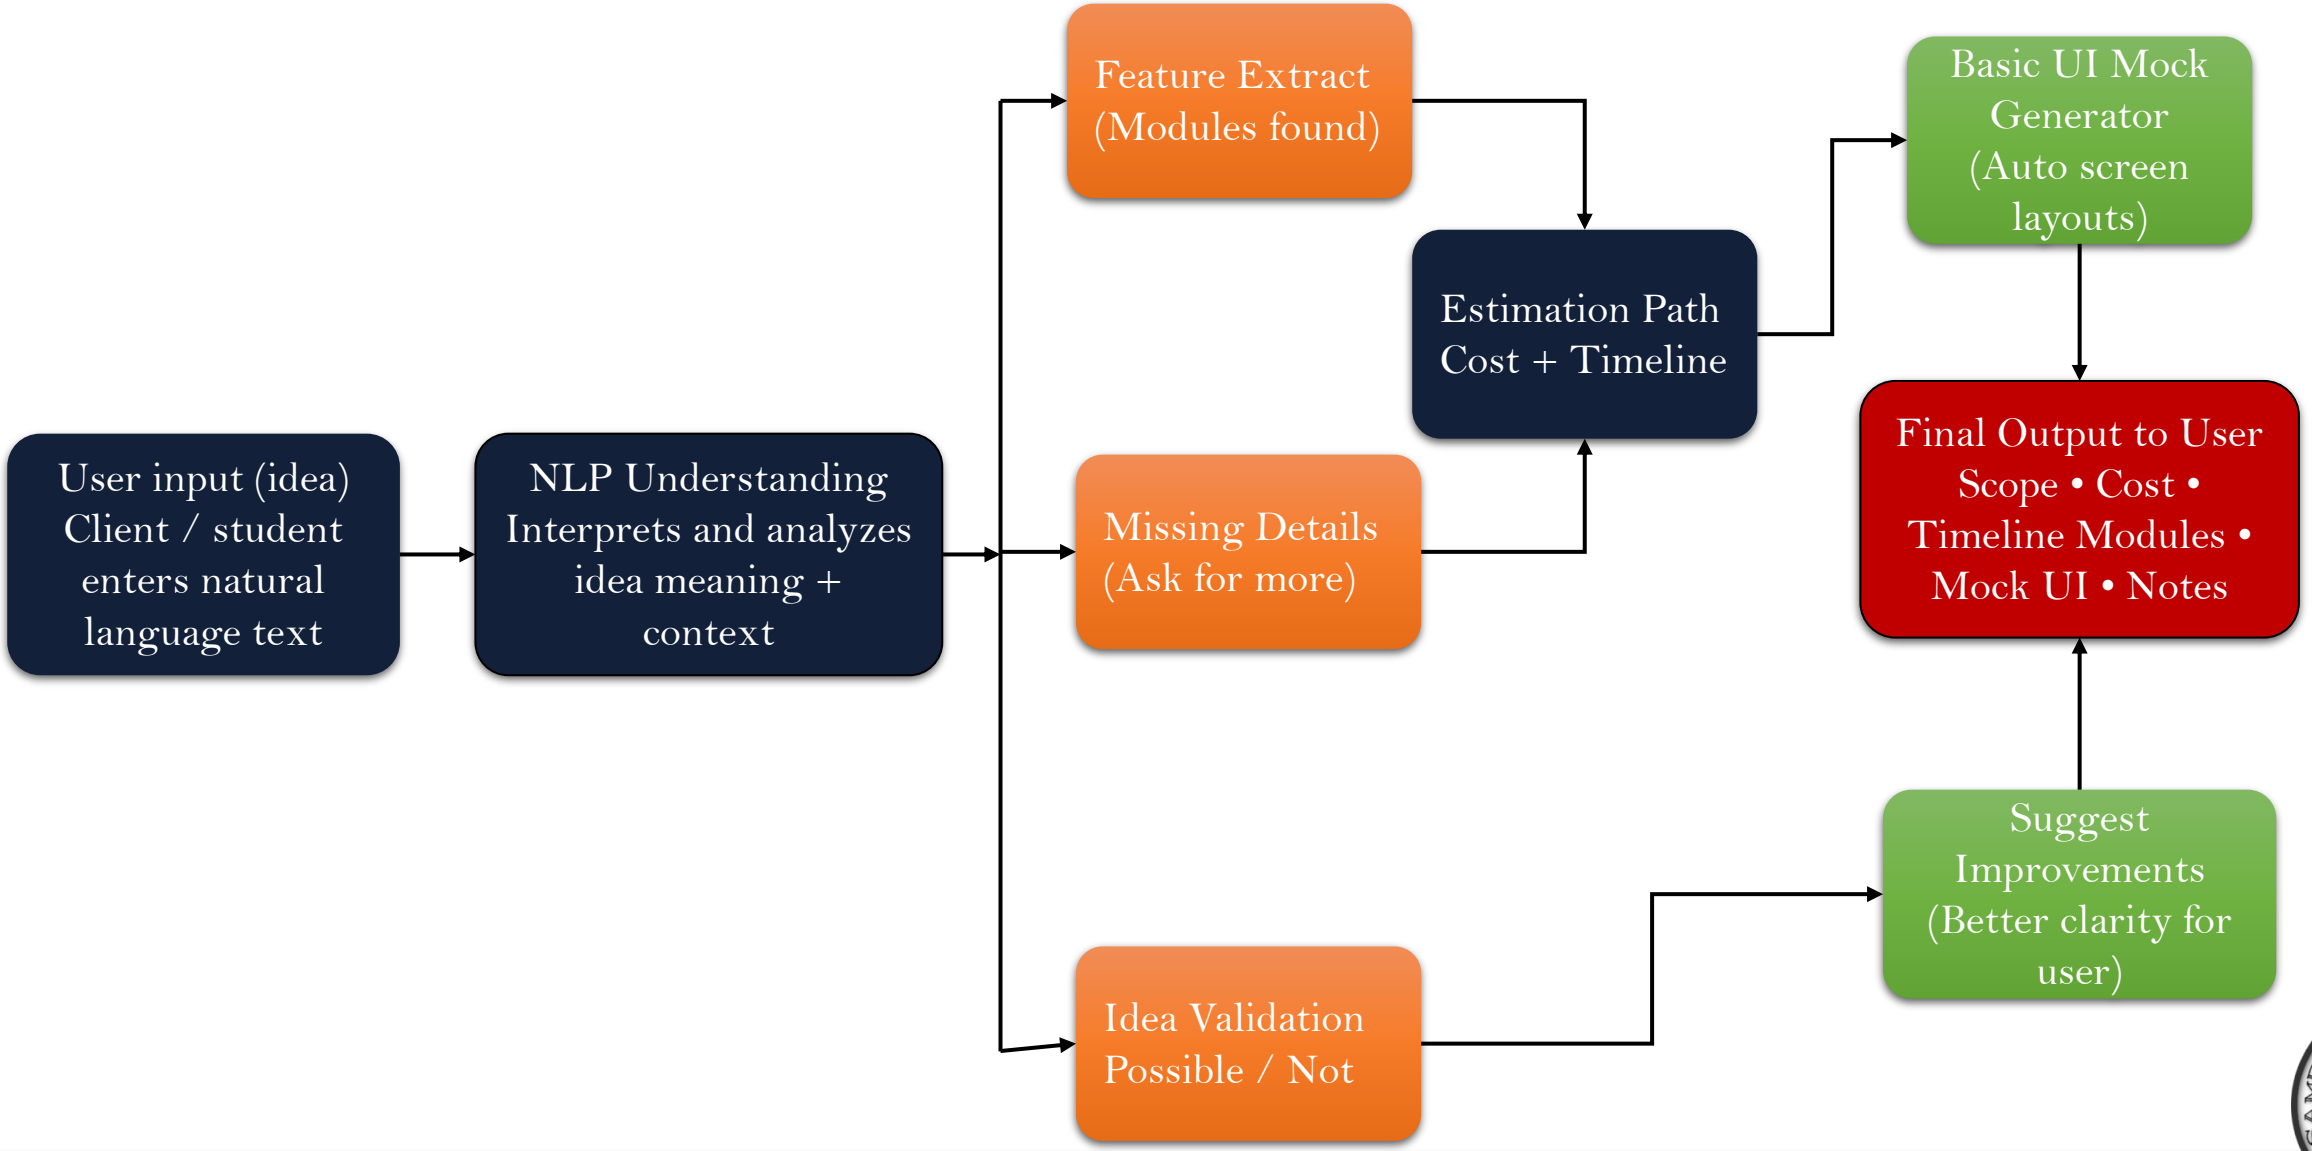
Natural Language Processing (NLP)

NLP is a branch of Artificial Intelligence that enables computers to understand, interpret, and process human language in a meaningful way. It allows the system to read user-described ideas, extract key information, and convert natural language into structured outputs.

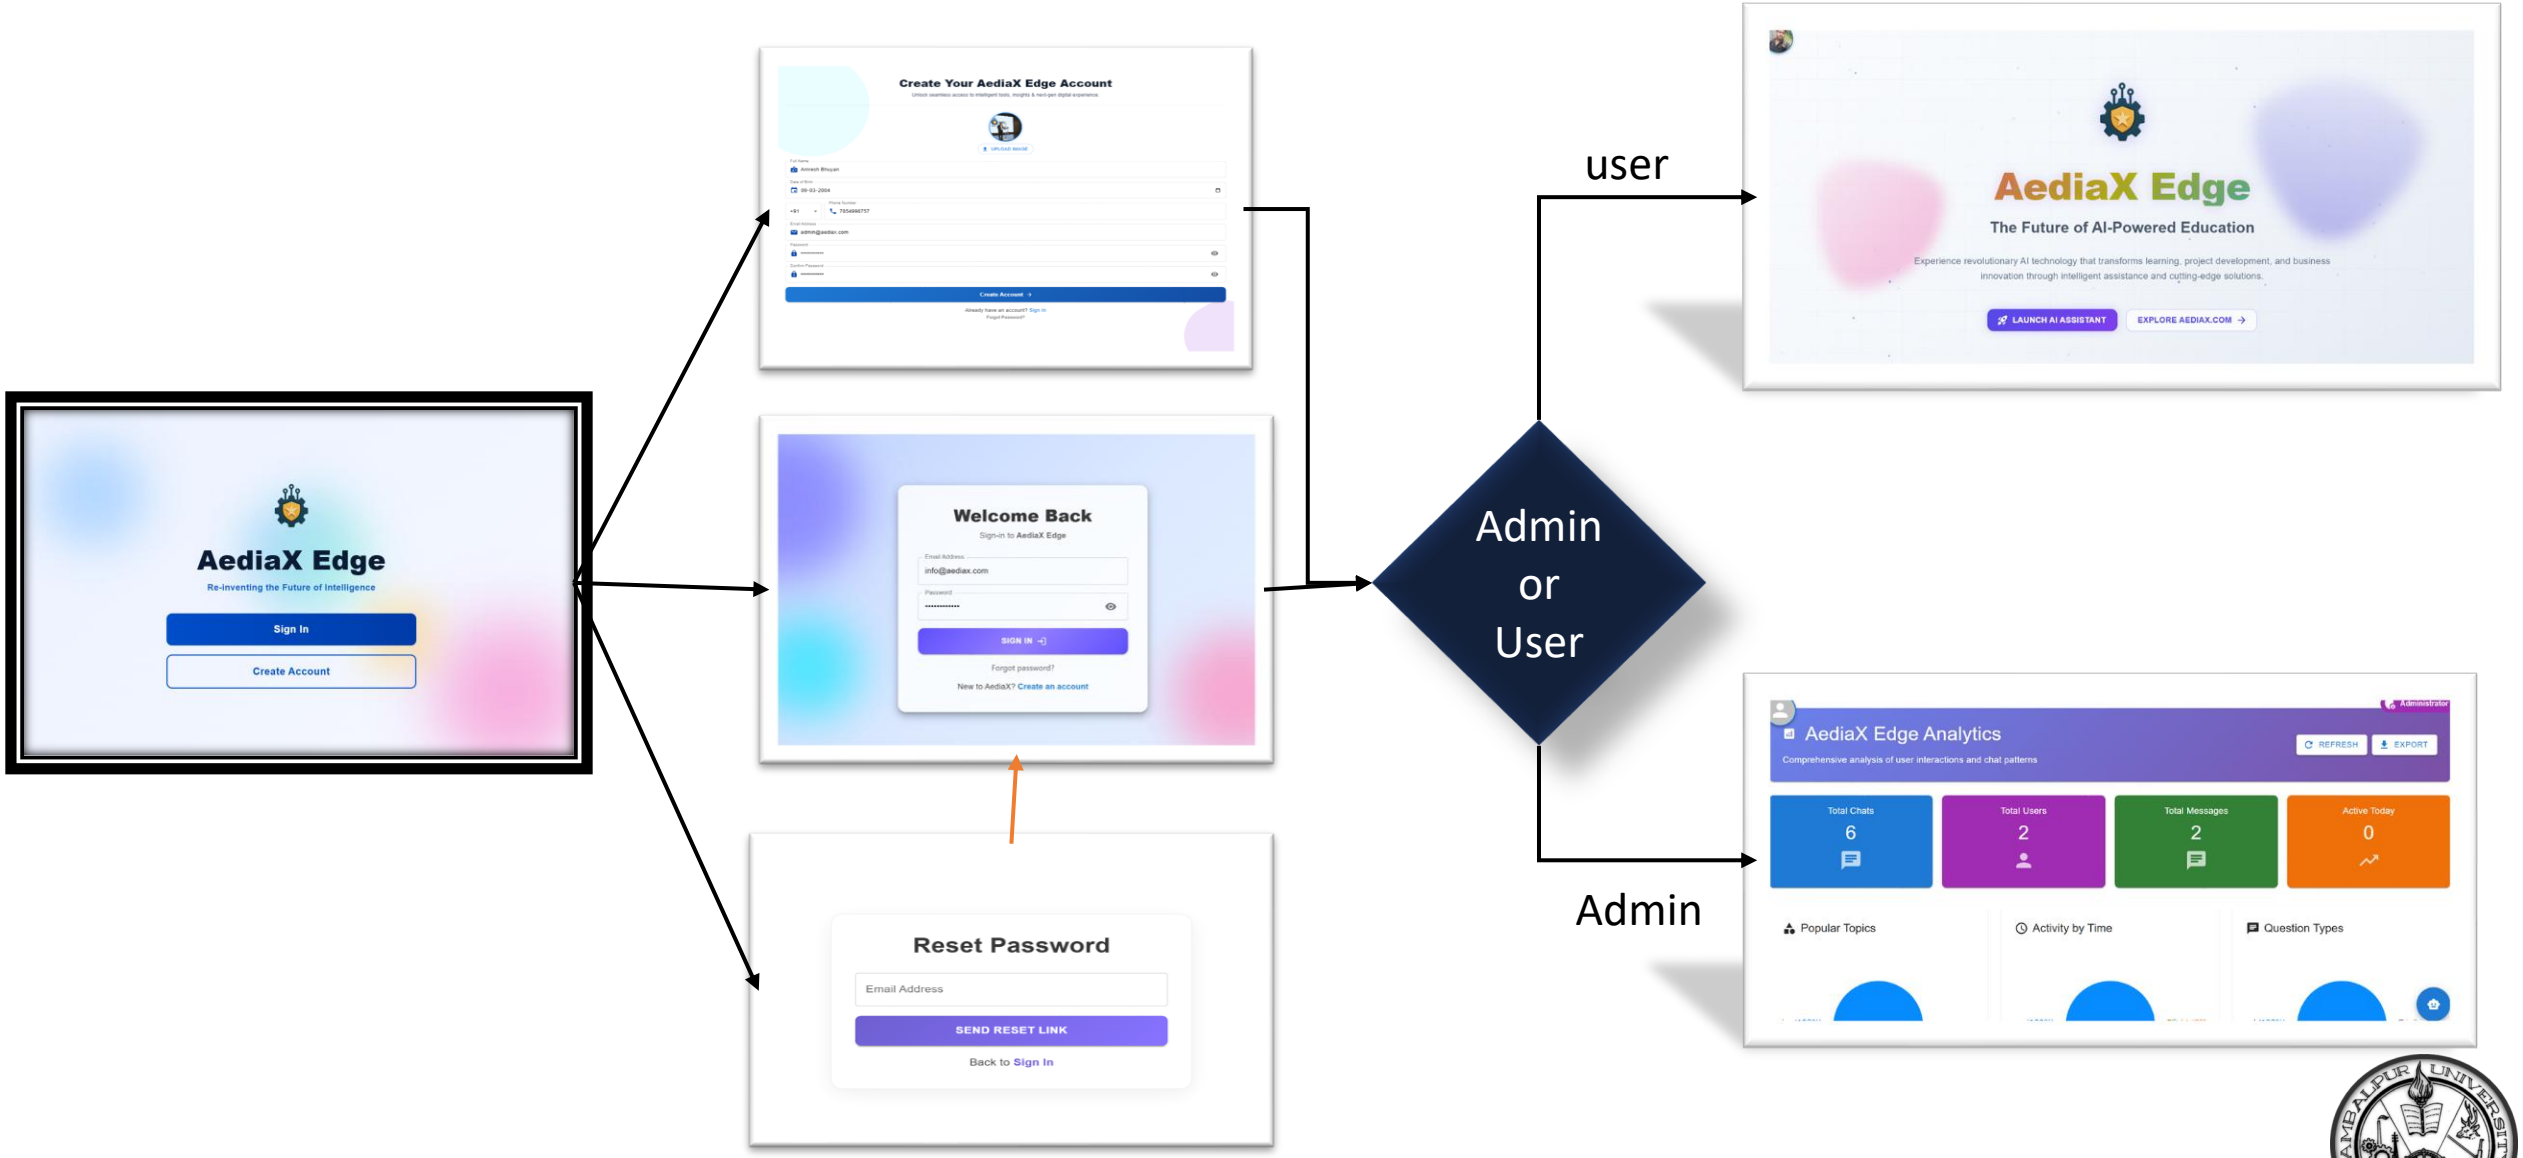
Work Flow : Development Side



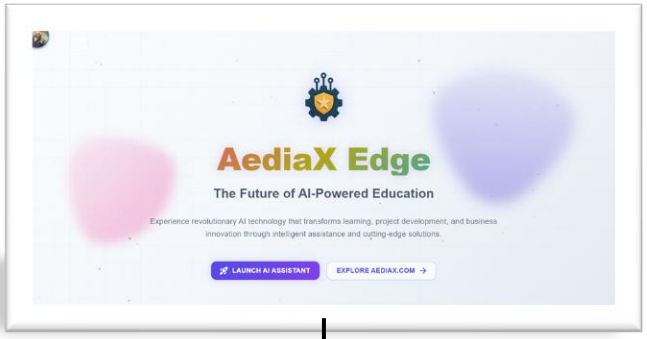
Work Flow : Software side

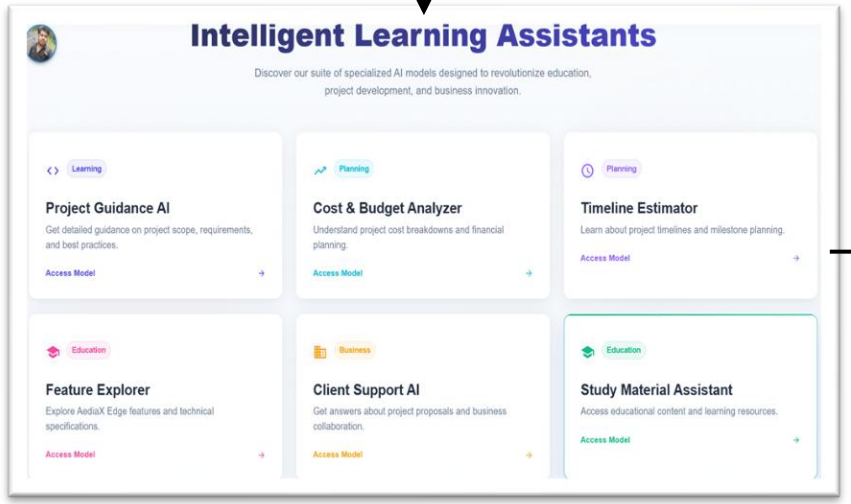


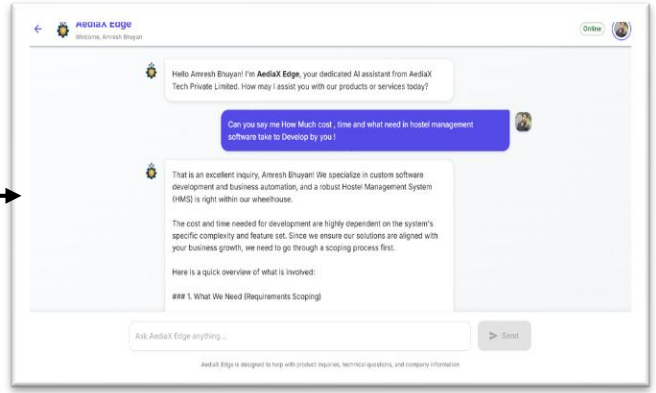
Work Flow : Software

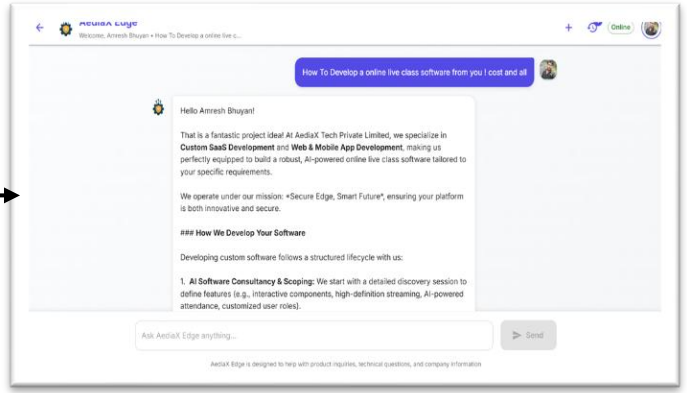


Work Flow : Software User Side



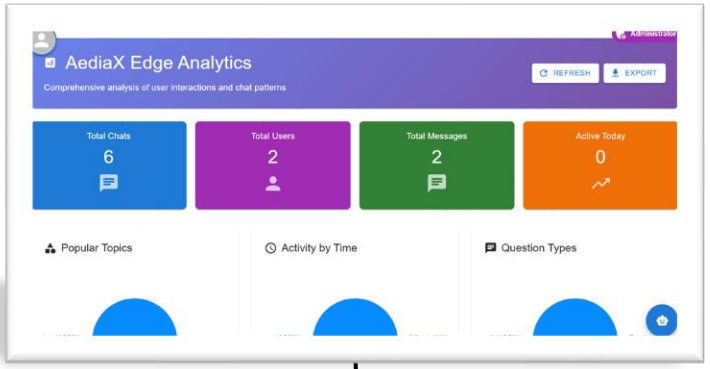


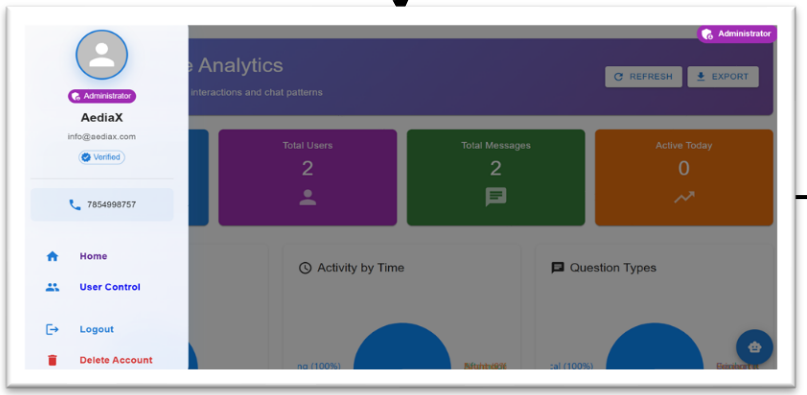


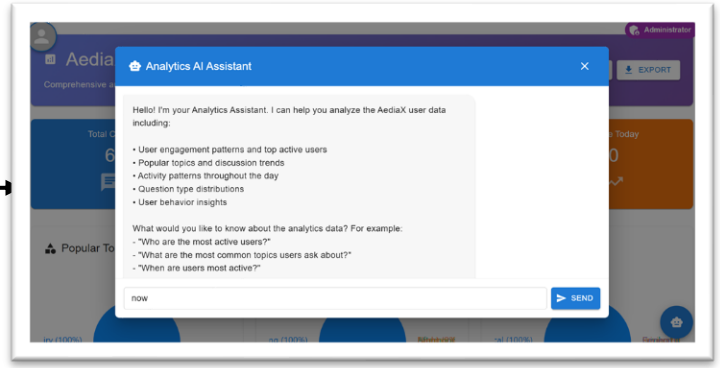


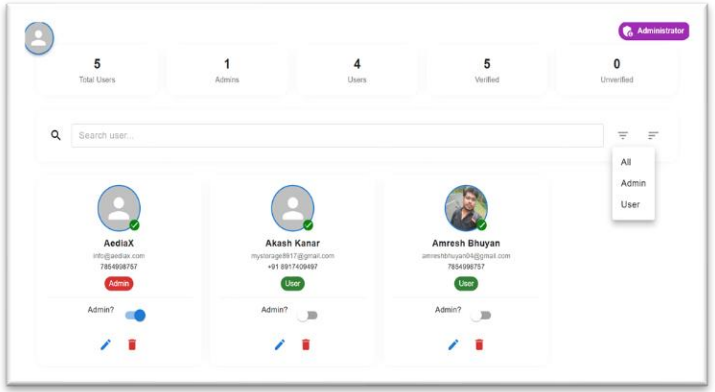
. . . More Models

Work Flow : Software Admin Side



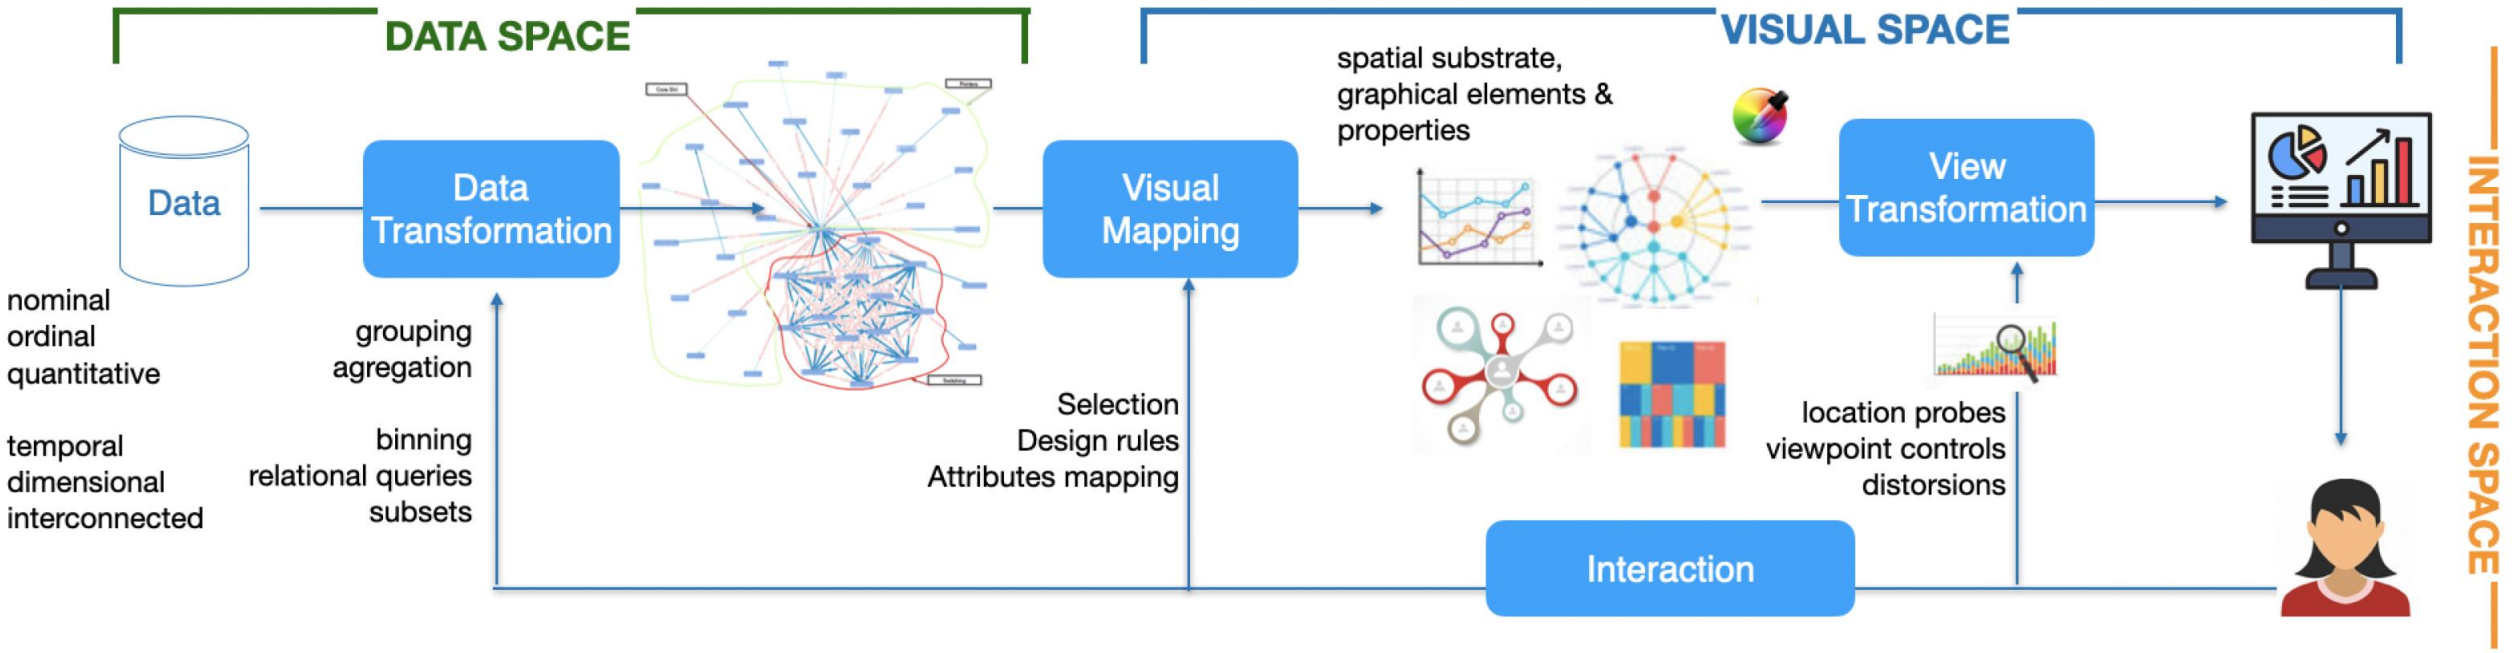






. . . More Controls and Analyzers

Work Flow : Data Space vs Virtual Space



Work Flow : Data Space vs Virtual Space

Data Space

Data Space refers to the environment or storage area where data actually exists, is stored, processed, and managed.It is **real**, measurable, and tied to physical or cloud-based storage.

Examples

- Your Firestore database
- Firebase Realtime DB
- Google Drive storage
- Hard disk, SSD
- Cloud storage buckets

Key Points

- Stores actual data (text, images, files, logs, analytics)
- Has storage limits (GB, TB)
- Used by systems to read/write information

Virtual Space

Virtual Space refers to a simulated or virtual environment created by software or AI where data, UI, or interactions appear but do not physically exist as stored files.
It is **conceptual**, generated dynamically in real time.

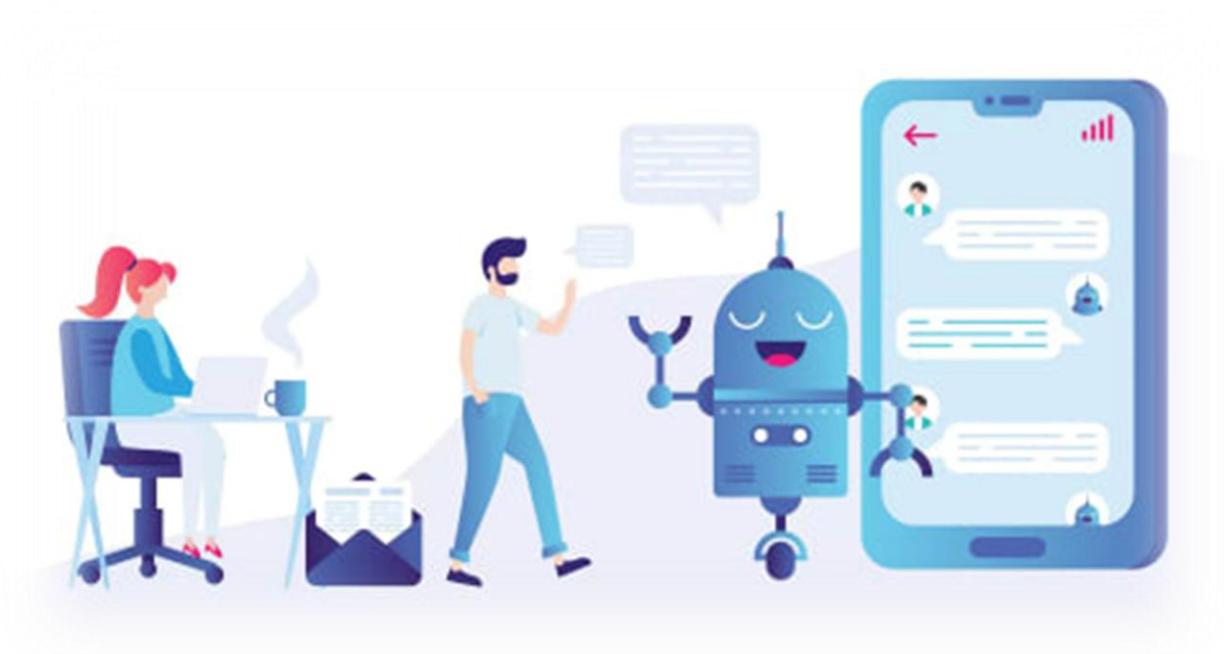
Examples

- A basic UI mock generated temporarily by AI
- Virtual classrooms, VR rooms
- Temporary memory used by applications
- AI simulation environments
- 3D virtual worlds

Key Points

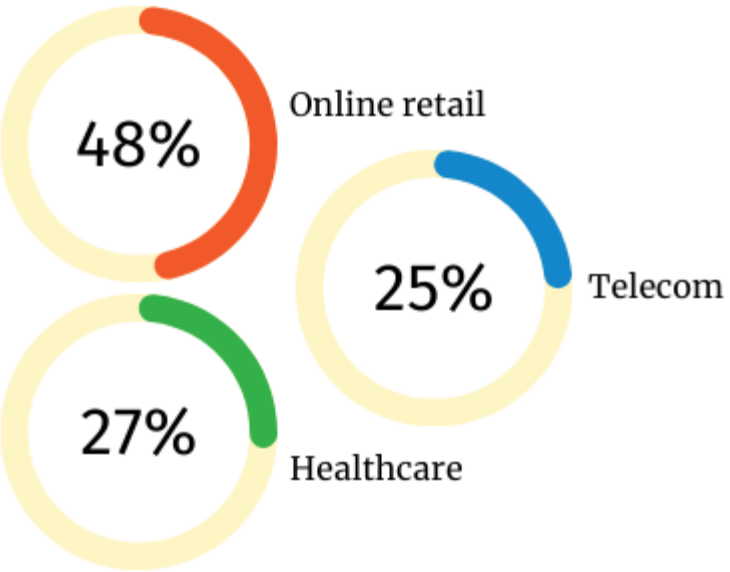
- Not real stored data
- Generated on demand
- Exists temporarily in RAM or simulation
- Used for visualization, testing, or interaction

Outcomes



Outcomes

AediaX Edge delivers clear and structured project requirements, accurate cost and timeline estimations, and basic UI mock screens directly from simple natural-language input. It significantly reduces the time spent explaining ideas to clients and students, improves clarity in early project discussions, and provides a faster, more reliable, and consistent way to evaluate and present software ideas.



Outcomes : Mathematically

1. Requirement Understanding Accuracy

The AI model converts user ideas into structured requirements with an average accuracy of:

$$Accuracy = \frac{Correct\ Requirements}{Total\ Requirements} \approx \mathbf{85\%}$$

2. Cost & Timeline Estimation Performance

The estimation model predicts development effort and duration with:

$$Cost = Effort \times Hourly\ Rate$$

$$Timeline = \frac{Effort}{Productivity}$$

Overall accuracy: **80–85%** compared to standard estimation methods.

Outcomes : mathematically

3. Usage Distribution (Where the Tool Is Used Most)

Use Case	% Usage
Requirement Understanding	**50%**
Searching / Clarification Queries	**30%**
Client Handling & Explanation	**15%**
Student Learning	**5%**

4. Benefit Distribution

Area	Benefit
Reduced communication time	**60% improvement**
Faster proposal creation	**55% improvement**
Better clarity for clients/students	**45% improvement**

5. Estimated Server Cost (Per User Per Chat)

Using Gemini AI + Firebase:

Cost *per Chat* $\approx$ **₹0.50 – ₹1.00**

This includes AI inference, Firestore reads/writes, hosting, and API usage.

Outcomes : Summary

AediaX Edge achieves an average requirement-understanding accuracy of 85% and delivers cost and timeline estimates with around 80–85% reliability. The system reduces communication and explanation time by nearly 60%, helping clients and students understand their project scope faster. Usage analysis shows that 50% of interactions focus on requirement understanding, 30% on searching and clarifications, and 15% on client handling. Each chat session costs approximately ₹0.50–₹1.00 to process, making the platform both efficient and scalable. Overall, AediaX Edge significantly enhances productivity, clarity, and early-stage project decision-making.

Feature Scope (Future Enhancements)

1. **AI-Driven Unified Management Layer** – Integration of a centralized AI management software across all management systems (Library Management, Company Management, University Management, etc.), enabling AI to autonomously handle calculations, data processing, decision support, reporting, and workflow optimization for each system.

Contribution to Industry

1. Automates early-stage requirement analysis for faster decision-making
2. Reduces communication time between companies and clients
3. Provides accurate cost and timeline estimates instantly
4. Improves transparency and trust in project planning
5. Offers basic UI prototypes for clearer requirement understanding
6. Standardizes proposal and estimation workflows across teams
7. Supports scalable AI-assisted software development practices
8. Enhances productivity for IT companies and startups
9. Helps bridge the gap between non-technical clients and developers

Conclusion

Conclusion

AediaX Edge successfully demonstrates how AI can simplify requirement analysis by converting simple ideas into structured outputs, cost estimates, timelines, and basic UI mock screens. It reduces communication effort, improves clarity for both clients and students, and provides a faster, more consistent way to evaluate software ideas. This system serves as a strong foundation for future AI-assisted development tools within AediaX Tech Private Limited and opens the path toward more efficient, intelligent, and scalable project planning.
